TITLE: Composite sheets for panels - are produced from webs of filaments with two different melting points to be heat bonded and compressed

INVENTOR: DEBALME, J; LOUBINOX, D ; SAINT-JOHN, C ; VOIRON, J ; DEBALME, J P ; SAINT, J C

PATENT-ASSIGNEE: VETROTEX FRANCE SA (COMP)

PRIORITY-DATA: 1997FR-0000387 (January 16, 1997), 1998CZ-0002090 (June 30, 1998), 1998JP-0179356 (June 25, 1998), 1998KR-0024266 (June 26, 1998)

ABSTRACTED-PUB-NO: FR 2758340A
BASIC-ABSTRACT:

Production of composite sheets for panels involves using at least one fabric of filaments in at least two materials with different melting points in a zone where they are heated to a temp. between their melting points and below the degradation temp. of the material with the lower melting point. The material is passed round a rotating bar, heated to this temp., and then it is compressed and cooled into a composite web. The web is converted into one or more composite sheets.

Also claimed is an assembly to produce the material, with one or more fabric feed and at least one heater and at least one heated rotating bar in the fabric movement path. At least one press compresses the material, followed by a cooling station.

The fabric contains at least 50 wt.% of co-mixed filaments using glass filaments and organic thermoplastic filaments, such as polyethylene terephthalate (PET), in an intimate mix. The material is used as a fabric.

At least one second and similar fabric is fed in continuously, and heated by rollers like the first,, and both fabrics are pressed together to be compressed simultaneously to form the composite web.

ADVANTAGE - The sheet material shows no distortion in the alignment of the filaments used in the material.

ABSTRACTED-PUB-NO: US 6294036B
EQUIVALENT-ABSTRACTS:

Production of composite sheets for panels involves using at least one fabric of filaments in at least two materials with different melting points in a zone where they are heated to a temp. between their melting points and below the degradation temp. of the material with the lower melting point. The material is passed round a rotating bar, heated to this temp., and then it is compressed and cooled into a composite web. The web is converted into one or more composite sheets.

Also claimed is an assembly to produce the material, with one or more fabric feed and at least one heater and at least one heated rotating bar in the fabric movement path. At least one press compresses the material, followed by a cooling station.

The fabric contains at least 50 wt.% of co-mixed filaments using glass filaments and organic thermoplastic filaments, such as polyethylene terephthalate (PET), in an intimate mix. The material is used as a fabric.
